

What I Need From You — Founder Setup & Registration Guide

LocalAI TV · Accounts, Services & Access · v1.3-aligned

To: Koneti Mohan Reddy (Founder & CEO) **From:** LocalAI TV Architecture Team **Date:** 16 May 2026

Purpose: Every account, service and access the team needs from you to start work — where to register, how, which plan, what it costs, and exactly what to hand the dev team. Written for a non-technical reader.

0. Read This First — 5 Rules

1. **You own every account.** All accounts are created by **you** (or someone you trust), under **your** email and billing. Never let anyone else create them in their name — you must own the company's infrastructure.
2. **I (the AI assistant) cannot and will not create accounts or take your passwords.** I do not register services, enter card details, or receive credentials. This guide tells *you* what to do; the dev team uses what you provide.
3. **Share secrets only through a password vault** (Section 4) — **never** over WhatsApp, email, chat, or this assistant. API keys and passwords sent over chat/email are a security risk.
4. **Turn on 2-Factor Authentication (2FA)** on every account the moment you create it.
5. **Register in two stages. Phase 0 = only AWS, now.** Everything else (**Phase 1**) you register **only after** the Phase 0 Validation Gate passes and you say "start." This protects you from paying for services months before they are used.

1. The 60-Second Summary

Stage	When	What you register	Rough monthly cost
Phase 0	Now — to start work & prove the system	AWS (1 account) + confirm you control the domain + confirm Hostinger VPS access	~₹2,000–₹30,000 (mostly the GPU server; cheaper if run only for tests)
Phase 1	Only after the gate passes & you say "start"	Supabase, Cloudflare, Google Cloud, Firebase, Sentry, Better Stack, PostHog, OpenAI, Sarvam, YouTube API, password vault, GitHub	~₹6,000–₹12,000 fixed + usage-based AI (scales with channels)

Do not register Phase 1 services yet. You would be paying for idle services. Phase 0 is enough to begin and to clear the validation gate.

2. Things You LIKELY ALREADY HAVE — Just Confirm & Hand Over

These exist from earlier work. Don't re-register — just confirm and provide access via the vault (Section 4):

Item	Status	What to provide the team
Hostinger VPS	The AI pipeline runs here today	SSH login (host, username, password/key)
Domain <code>localaitv.com</code>	In use (<code>aiservices.localaitv.com</code> , marketing site)	Login to the domain registrar (where you bought the domain) — needed to point DNS later
2Factor.in (SMS OTP)	Already registered	<code>TWOFACOR_API_KEY</code> ; also confirm DLT registration (sender ID + template approval) is complete
Google Cloud (Gemini + Telugu Text-to-Speech)	Pipeline already uses these	Confirm the existing GCP project + billing is active; provide the service-account key file
GitHub	Account <code>nagarjunak-pixel</code> exists	You'll create one new private repo + invite the team (Section 3)

If any of the above is *not* actually set up, treat it as a Phase 1 item below.

3. The Services — Where, How, Which Plan, What to Hand Over

PHASE 0 — Register NOW (needed to start work and clear the gate)

3.1 AWS (Amazon Web Services) — the only must-have to start

- **What it is / why:** The GPU server (EC2) that makes video generation fast, and the storage (S3) where finished videos live. This is the heart of Phase 0.
- **Where:** `https://aws.amazon.com` → "Create an AWS Account."
- **How to register:**
 1. Sign up with your business email.
 2. Add a credit/debit card (AWS does a small ~₹2 verification).
 3. Verify phone (OTP).
 4. Choose the **Basic (free) support plan**.
 5. Turn on **2FA** (IAM → your user → security).
 6. Set a **Billing Budget alert** (Billing → Budgets → e.g. alert at ₹35,000/mo) so there are no surprises.
- **Region to choose everywhere: Asia Pacific (Mumbai) — `ap-south-1`**. Use this and nothing else.
- **What the team needs you to create (you click; they guide if needed — over a call, not by you sending passwords):**
 - An **IAM user** for the dev team with **programmatic access** (an *Access Key ID* + *Secret Access Key*) limited to S3 + EC2 — **not** your root login.
 - One **S3 bucket**: `localaitv-content-mumbai` (region ap-south-1).

- **Plan/cost:** Pay-as-you-go. The GPU server (g4dn.xlarge) is ~₹30,000/month if left running 24x7 — in Phase 0 it can be **started only for tests**, costing far less. S3 storage for test files is negligible (a few rupees).
- **Hand to team (via vault):** IAM Access Key ID + Secret, region `ap-south-1`, bucket name. **Never the root email/password.**
- ☐ Account created ☐ 2FA on ☐ Budget alert set ☐ IAM key created ☐ S3 bucket created ☐ Shared via vault

3.2 Domain DNS access (you likely already own the domain)

- **Why:** To later point `content.localaitv.com`, `pipeline.localaitv.com`, `api.localaitv.com` to the servers.
- **Action now:** Just **locate and confirm your domain registrar login** (where `localaitv.com` was purchased — e.g. GoDaddy/Hostinger/BigRock). No changes yet.
- **Cost:** Already paid (annual ~₹900). Nothing new.
- ☐ Registrar login located ☐ Noted for the team

Phase 0 stops here. With AWS + the existing VPS + domain confirmed, the team can run Phase 0 and the Validation Gate. **Do not proceed to Phase 1 until the gate passes and you say "start."**

PHASE 1 — Register ONLY AFTER the gate passes and you say "start"

For each: what it is → where → plan → what to hand over.

3.3 Supabase — Admin Dashboard database + login system

- **Why:** Stores moderation data and admin logins for the Admin Dashboard.
- **Where:** `https://supabase.com` → sign up (GitHub or email) → New Project → **Region: Mumbai (ap-south-1)**.
- **Plan: Pro** — about **\$25/month (~₹2,100)**.
- **Hand over:** Project URL, API keys (anon + service), database connection string.
- ☐ Done ☐ 2FA ☐ Vault

3.4 Cloudflare — CDN, security (WAF), bot protection (Turnstile)

- **Why:** Makes video delivery fast and cheap worldwide and protects against attacks.
- **Where:** `https://www.cloudflare.com` → sign up → "Add a site" → enter `localaitv.com` → it will give you 2 nameservers to set at your domain registrar.
- **Plan: Free** to start (enough for CDN + basic WAF + Turnstile). Pro (\$20/mo ~₹1,700) only later if needed.
- **Hand over:** Cloudflare account access for DNS setup (the team will guide the DNS records on a call).
- ☐ Done ☐ 2FA ☐ Vault

3.5 Google Cloud — Gemini (script writing) + Telugu Text-to-Speech

- **Why:** Writes the news script and converts it to a Telugu voice. **Likely already set up** (the pipeline uses it) — confirm billing is active.

- **Where:** <https://console.cloud.google.com> → confirm project + Billing enabled → APIs: "Generative Language / Vertex AI" + "Cloud Text-to-Speech".
- **Plan:** Pay-per-use. Set a **Budget alert** (Billing → Budgets). Telugu voice ≈ usage-based; low at small scale.
- **Hand over:** Service-account JSON key file (via vault).
- ☐ Confirmed ☐ Budget alert ☐ Vault

3.6 Firebase (Google) — push notifications

- **Why:** "Your content is live / airs in 10 min" phone notifications.
- **Where:** <https://console.firebase.google.com> → Add project (can reuse the Google Cloud project).
- **Plan:** **Free** (Spark) is enough.
- **Hand over:** Firebase config + server key.
- ☐ Done ☐ Vault

3.7 OpenAI — backup script engine (only used if Gemini fails)

- **Where:** <https://platform.openai.com> → sign up → Billing → add small credit → create API key.
- **Plan:** Pay-as-you-go; fallback only, so low cost.
- **Hand over:** API key.
- ☐ Done ☐ 2FA ☐ Vault

3.8 Sarvam AI — backup Telugu voice (only used if Google TTS fails)

- **Where:** <https://www.sarvam.ai> → sign up → API key.
- **Plan:** Pay-as-you-go; fallback only.
- **Hand over:** API key.
- ☐ Done ☐ Vault

3.9 YouTube Data API — live channel integration

- **Why:** For the LIVE TV channels.
- **Where:** In the same Google Cloud Console → enable "YouTube Data API v3"; have a YouTube/Brand channel ready.
- **Plan:** Free quota (sufficient initially).
- **Hand over:** API key / OAuth client (via vault).
- ☐ Done ☐ Vault

3.10 Monitoring — Sentry + Better Stack + PostHog

- **Sentry** (error alerts): <https://sentry.io> — **Free** tier fine to start; Team ~\$26/mo later.
- **Better Stack** (is the site up? logs): <https://betterstack.com> — **Free** tier to start.
- **PostHog** (usage analytics): <https://posthog.com> — **Free** (1M events/mo).
- **Hand over:** Each project's key (via vault).
- ☐ Sentry ☐ Better Stack ☐ PostHog ☐ Vault

3.11 Password Vault — Bitwarden or 1Password (set this up EARLY in Phase 1)

- **Why:** The single safe way to give the dev team all the keys above.
- **Where:** <https://bitwarden.com> (**Free**, works well) or <https://1password.com> (~\$3/user/mo).
- **How:** Create an organization → one shared "LocalAI TV" vault → invite **Sameer** and **Gnana** → put every key/credential there.
- ☐ Vault created ☐ Team invited

3.12 GitHub — code repository + team access

- **Why:** Where the Admin Dashboard code lives.
- **Where:** <https://github.com> (you have `nagarjunak-pixel`). Create a **new private repo** (e.g. `localaitv-admin-dashboard`) → Settings → Collaborators → invite Sameer & Gnana.
- **Plan:** **Free** is enough for private repos.
- ☐ Repo created ☐ Team invited

3.13 2Factor.in — SMS OTP (already registered — just confirm)

- **Confirm:** `TWOFACOR_API_KEY` is available, SMS credit balance is topped up, and **DLT registration** (sender ID + message templates) is approved (mandatory in India).
- **Hand over:** API key (via vault) + DLT status.
- ☐ Key ready ☐ DLT confirmed ☐ Vault

4. The Secure Hand-Over Procedure (do this exactly)

1. Create each account **yourself**, under your business email.
2. Turn on **2FA** immediately on each.
3. Put each credential (API key, access key, connection string) into the **shared password vault** (Section 3.11).
4. Invite **only Sheikh Sameer and Gnana Rajnan** to that vault.
5. **Never** paste any key into WhatsApp, email, this chat, or a document.
6. For anything needing screen-sharing (e.g. AWS IAM setup), do it on a **live call** with the team — you click, they guide. You never reveal a password on screen.

5. Cost Summary (approximate, INR/month)

Service	Phase 0 (now)	Phase 1 (after gate)	Notes
AWS EC2 GPU	₹2,000–₹30,000	scales with channels	Less in Phase 0 if started only for tests
AWS S3 storage	~₹0 (test)	grows with content	Cheap per-GB; CDN cuts delivery cost
Supabase	—	~₹2,100	Pro plan
Cloudflare	—	₹0 (Free)	Pro only if needed later
Google Cloud (Gemini+TTS)	—	usage-based	Set a budget alert
Firebase / PostHog / Better Stack / Sentry	—	₹0 (free tiers)	Paid only at scale
OpenAI / Sarvam	—	low (fallback only)	Used rarely
Password vault	—	₹0 (Bitwarden)	Or 1Password paid
GitHub / 2Factor	—	₹0 / already paid	—
Rough total	₹2K–₹30K	~₹6K–₹12K fixed + AI usage	Big scale economics are in Plan v1.3 §19

These are onboarding/registration costs. The full scale economics (300 → 3,000 channels) are already in **Plan v1.3 §19** — not repeated here.

6. Your Action Checklist (in order)

Now (Phase 0):

- ☐ Create AWS account, enable 2FA, set budget alert
- ☐ Create IAM key (S3+EC2 only) + S3 bucket `localaitv-content-mumbai` (ap-south-1)
- ☐ Confirm Hostinger VPS access
- ☐ Locate domain registrar login
- ☐ Put the AWS IAM key + VPS access in a vault (set up Bitwarden now if easier) and share with Sameer & Gnana
- ☐ Tell the team "Phase 0 access ready"

Later (only after the gate passes AND you say "start"):

- ☐ Work down Section 3.3 → 3.13, one per row, each into the vault

7. What Happens Next

1. You complete the **Phase 0** checklist (just AWS + confirmations).
2. The team runs Phase 0 and the Validation Gate (their work, not yours).
3. Gate numbers come back → you review → you say "start."

4. **Only then** you work the Phase 1 list above, and coding begins.

You do **not** need to do anything technical — just create accounts, enable 2FA, and place keys in the vault. The team does the rest with what you provide. I will never ask you for a password or create an account on your behalf.

LocalAI TV Architecture Team LocalAI Media Network Pvt Ltd · CIN: U63910KA2025PTC212593 ·
Hyderabad, India

*Phase 0 = AWS only, now. Phase 1 = everything else, only after the gate passes and you say "start."
Nothing here changes Plan v1.3.*
